

IN THE SPECIFICATION:

Page 2, lines 16-24, replace the paragraph with the following amended paragraph:

In an embodiment of the invention, the reinforced polymer is a ~~polyarylamide-based~~ polyarylamide-based compound. This material has the advantage, that in injection moulding it may be caused to produce a surface layer with low fibre content, and thereby the surface quality of the moulded part will be close to the quality obtainable with materials with no fibre reinforcement. Even with a very high fibre contents this material may be caused to produce high quality surfaces. Also, thin walled parts are producible with high fibre contents using this material. Thus, this material is especially well suited for hearing aid and similar communication parts, where typically complex shapes must be moulded, and where further the demands to the surface appearance are very high.
